Adolescent Reproductive Health Information Support & Empowerment

ADOLESCENT GROWTH

Reproductive Anatomy

Student Study Guide & Quiz Answer Key

Module:	Adolescent Growth
Lesson:	Reproductive Anatomy
Quiz:	25 marks (10 MCQ + 5 Fill-in-blanks + 3 Short Answer)
Pass Mark:	15/25 (60%) — Certificate awarded at 60%+
Languages:	English Kiswahili Sheng

Learning Outcomes

By the end of this lesson, you will be able to:

1. Identify and describe the organs of the female reproductive system
2. Identify and describe the organs of the male reproductive system
3. Trace the process of fertilisation and early pregnancy
4. Explain how anatomy knowledge supports reproductive health decisions

Slide 2: Female Reproductive System

Understanding your anatomy is the foundation of reproductive health. Knowledge protects you.

Organ	Location	Function
Ovaries (×2)	Sides of uterus	Produce eggs (ova) & hormones oestrogen/progesterone
Fallopian Tubes (×2)	Connect ovaries to uterus	Transport egg; site of fertilisation
Uterus (Womb)	Lower abdomen	Where foetus develops for ~40 weeks
Cervix	Lower uterus	Opening between uterus and vagina; dilates during birth
Vagina	External opening	Birth canal; menstrual flow passage; receives penis

Slide 3: Male Reproductive System

Understanding the male reproductive system helps everyone — boys and girls — understand human biology and relationships.

Organ	Function
Testes (×2)	Produce sperm and testosterone
Scrotum	Holds testes; regulates temperature for sperm
Epididymis	Sperm mature and are stored here after leaving testes
Vas Deferens	Tube that carries sperm from epididymis toward urethra
Seminal Vesicles & Prostate	Add fluids to sperm to form semen
Penis & Urethra	Delivers sperm during ejaculation; also carries urine

■ ■ *Did You Know?*

Slide 4: Fertilisation & Pregnancy

Understanding how pregnancy occurs is essential for making informed reproductive health choices.

Step	What Happens
1. Ovulation	Egg released from ovary (~Day 14)
2. Sperm Journey	Sperm travel through vagina → cervix → uterus → fallopian tube
3. Fertilisation	One sperm fuses with egg in fallopian tube
4. Implantation	Fertilised egg travels to uterus and implants in lining (~Day 6–10 after fertilisation)
5. Pregnancy	Foetus develops over ~40 weeks (9 months)

■ No method except ABSTINENCE is 100% effective at preventing pregnancy. If sperm and egg meet at ovulation, fertilisation can occur. This is why understanding your cycle matters.

Slide 5: Reproductive Health & Self-Care

Knowing your anatomy helps you notice problems early and seek care quickly.

Omondi, 16, noticed a painless lump in his testis. He was embarrassed and told no one for 3 months. When he finally told his uncle, he was taken to a clinic — it turned out to be a harmless cyst, but the doctor praised him: 'You were right to come. Early detection saves lives.' Omondi now tells his friends: check yourselves.

Slide 6: Module Video

Watch carefully, then continue to the scenarios.

Slide 7: Real Talk — What Would You Do?

Pick your choice and see the consequence.

Slide 8: Protecting Your Reproductive Health

Your reproductive organs need care — start healthy habits now.

Quiz — Answer Key

Total: 25 marks | Pass: 15/25 (60%) | Certificate at 60%+

Part A: Multiple Choice (10 marks)

1. 1. The female organ where a foetus develops during pregnancy is:

- ☐ A. Ovary
- ☐ B. Fallopian tube
- ☒ C. Uterus (womb)
- ☐ D. Cervix

2. 2. Fertilisation normally occurs in:

- ☐ A. The uterus
- ☐ B. The ovary
- ☒ C. The fallopian tube
- ☐ D. The vagina

3. 3. The male organ that produces sperm is:

- ☐ A. Penis
- ☐ B. Prostate gland
- ☒ C. Testis (testicle)
- ☐ D. Scrotum

4. 4. The cervix is:

- ☐ A. The outer female genitalia
- ☒ B. The lower narrow part of the uterus that connects to the vagina
- ☐ C. The organ that produces eggs
- ☐ D. Another name for the ovary

5. 5. How many eggs does a woman typically release per menstrual cycle?

- ☐ A. 10–20
- ☒ B. 1 (occasionally 2)
- ☐ C. 100
- ☐ D. None — eggs are only released at puberty

6. 6. The epididymis in the male reproductive system:

- ☐ A. Produces the male hormone testosterone
- ☒ B. Is where sperm mature and are stored temporarily
- ☐ C. Transports urine only
- ☐ D. Is the outer protective layer

7. 7. Ovulation occurs approximately on day ___ of a 28-day cycle:

- ☐ A. Day 1
- ☐ B. Day 7
- ☒ C. Day 14
- ☐ D. Day 28

8. 8. The function of the vagina includes:

- ☐ A. Producing eggs

☒ B. Birth canal, passage for menstrual flow, and reception of the penis during intercourse

☐ C. Storing sperm permanently

☐ D. Producing testosterone

9. 9. Sperm can survive inside the female reproductive tract for up to:

☐ A. 30 minutes

☒ B. 5 days

☐ C. 2 weeks

☐ D. 1 month

10. 10. A key reason to learn about reproductive anatomy is:

☐ A. To pass biology exams only

☒ B. To understand your body, recognise health problems early, and make informed decisions

☐ C. It is only relevant for medical students

☐ D. To memorise Latin terms

Part C: Short Answer (25 marks)

1. 1. The organ where the foetus develops during pregnancy is called the _____. (3 marks)

2. 2. Fertilisation normally occurs in the _____ tube. (3 marks)

3. 3. The male organs that produce sperm and testosterone are called the _____. (3 marks)

4. 4. In a 28-day cycle, ovulation typically occurs around day _____. (3 marks)

5. 5. Sperm can survive in the female reproductive tract for up to _____ days. (3 marks)

6. Name and describe the function of THREE organs in the female reproductive system. (3 marks marks) (3 marks)

7. Trace the journey of a sperm cell from production to fertilisation. (4 marks marks) (4 marks)

8. Why is it important for teenagers to learn reproductive anatomy? Give TWO reasons. (3 marks marks) (3 marks)
